DYSTROPHY  
FOUNDATION

Care and a Cure

2018  
**MDF ANNUAL CONFERENCE**  
September 14-15, 2018  
Nashville, TN

# DM 101: GETTING A HANDLE ON THE BASICS

Nicholas Johnson, MD, MSCI

# Overview

---

- Myotonic Dystrophy genetics
- Myotonic Dystrophy type 1 diagnosis
- Myotonic dystrophy type 1 symptoms
- Myotonic dystrophy type 2 diagnosis
- Myotonic dystrophy type 2 symptoms

# Myotonic dystrophy (Dystrophia myotonica)

---

- Two disorders: type 1 and type 2
- Both disorders are caused by repeat expansion
- Repeat expansion impairs RNA splicing
- Different symptoms/overlapping symptoms

# Why is DM described as “the most variable human disease?”

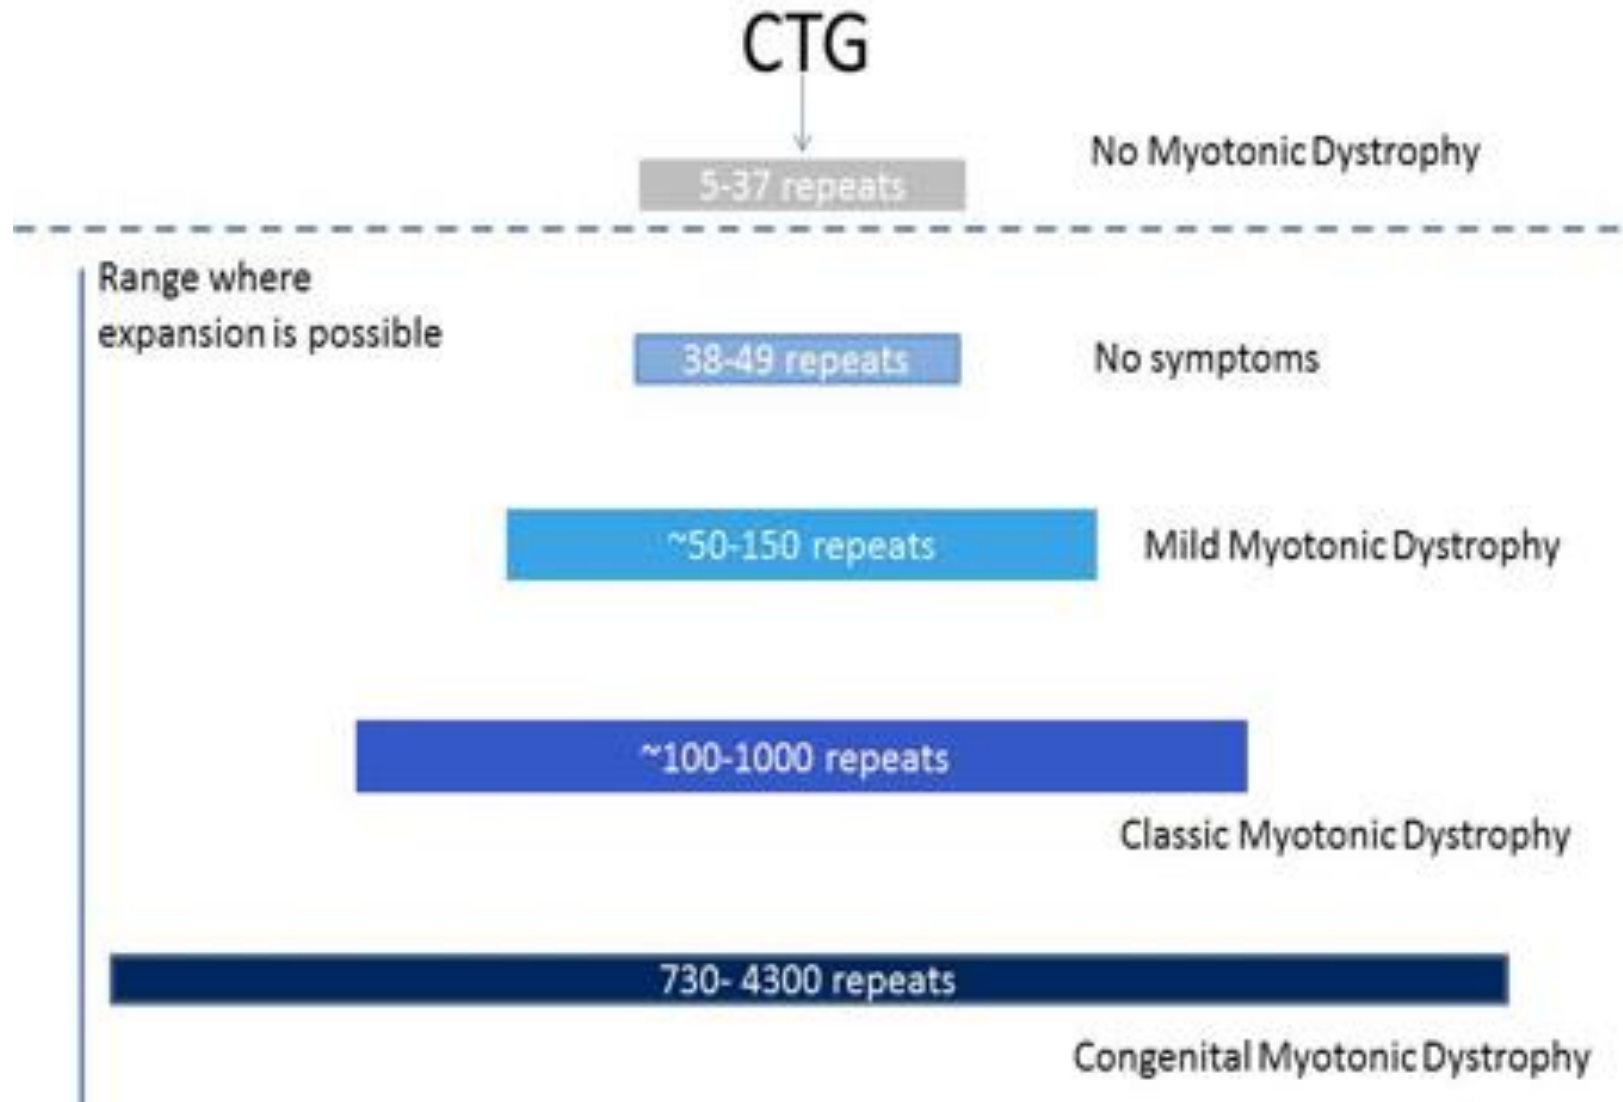

- Most genetic disorders are due to a single missing protein or too much of a single protein (all or none)
- DM genetics are influenced by:
  - ▣ Repeat length
  - ▣ Somatic mosaicism/repeat instability

# What gene mutation causes DM1?

---

- DMPK (dystrophica myotonia protein kinase) gene
- Non-coding Trinucleotide repeat  
...CTG CTG CTG CTG CTG...

# Myotonic Dystrophy Type 1

# Sub definitions of DM1

---

- Congenital onset (symptoms start at birth)
- Childhood onset (symptoms before age 10)
- Adult onset (symptoms after 10)
- Mild/late onset/oligosymptomatic

# What gene mutation cause DM2?

- Zinc finger 9 (ZNF9) gene = cellular retroviral nucleic acid binding protein 1 (CNBP)
- Non-coding Tetranucleotide repeat
- ...CCTG CCTG CCTG CCTG ...

# Myotonic Dystrophy type 2

CCTG

11- 26 repeats

Normal repeat number

27-74 repeats

Borderline expansions

---

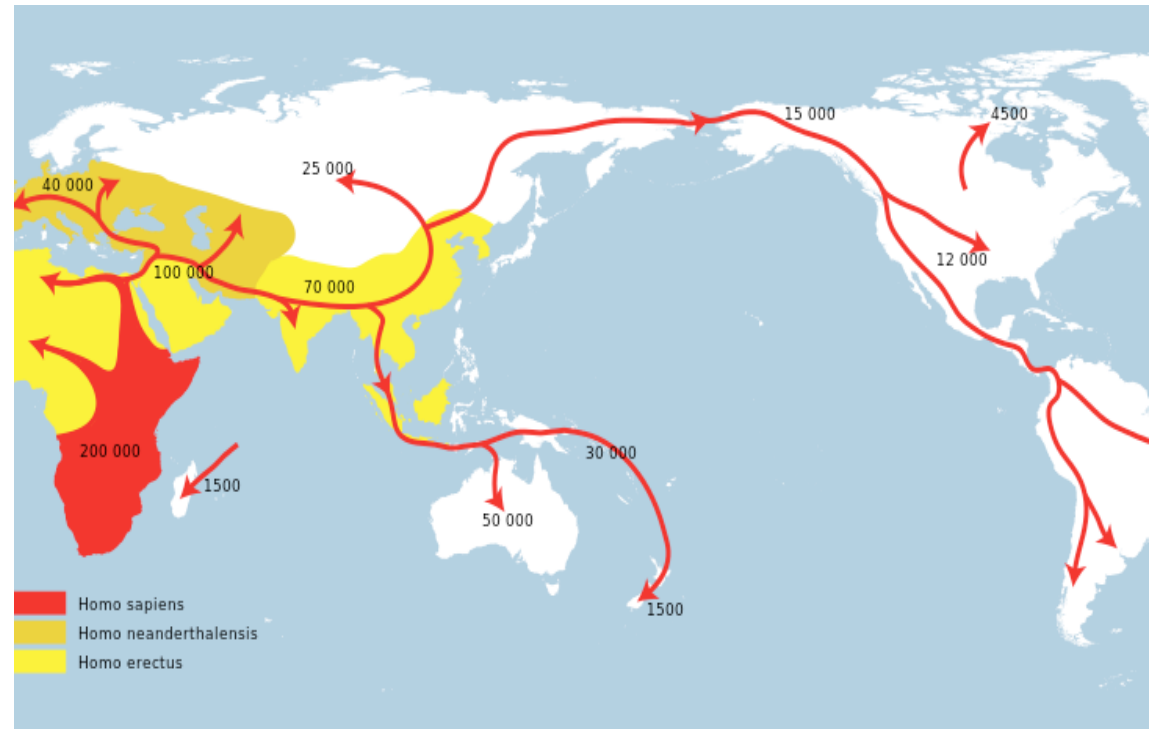

Range where expansion  
Or contraction is possible

75-11,000 repeats

Myotonic dystrophy type 2

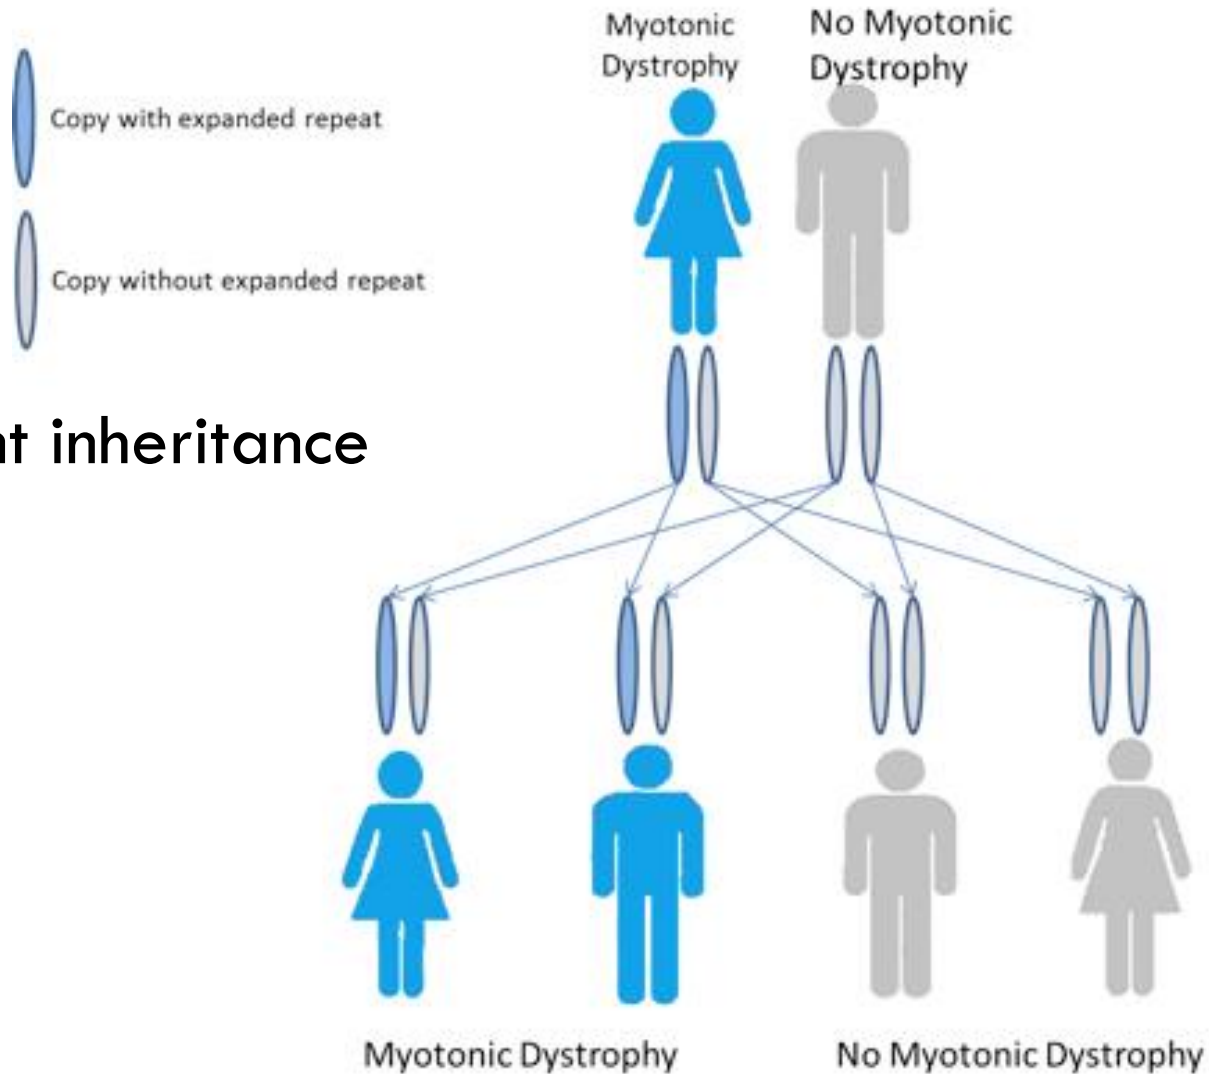

# Where did DM come from?

- DM1
  - Out of Africa migration
- DM2
  - 1,000- 2,000 BC

Wikipedia, early human migrations

# How is it inherited?

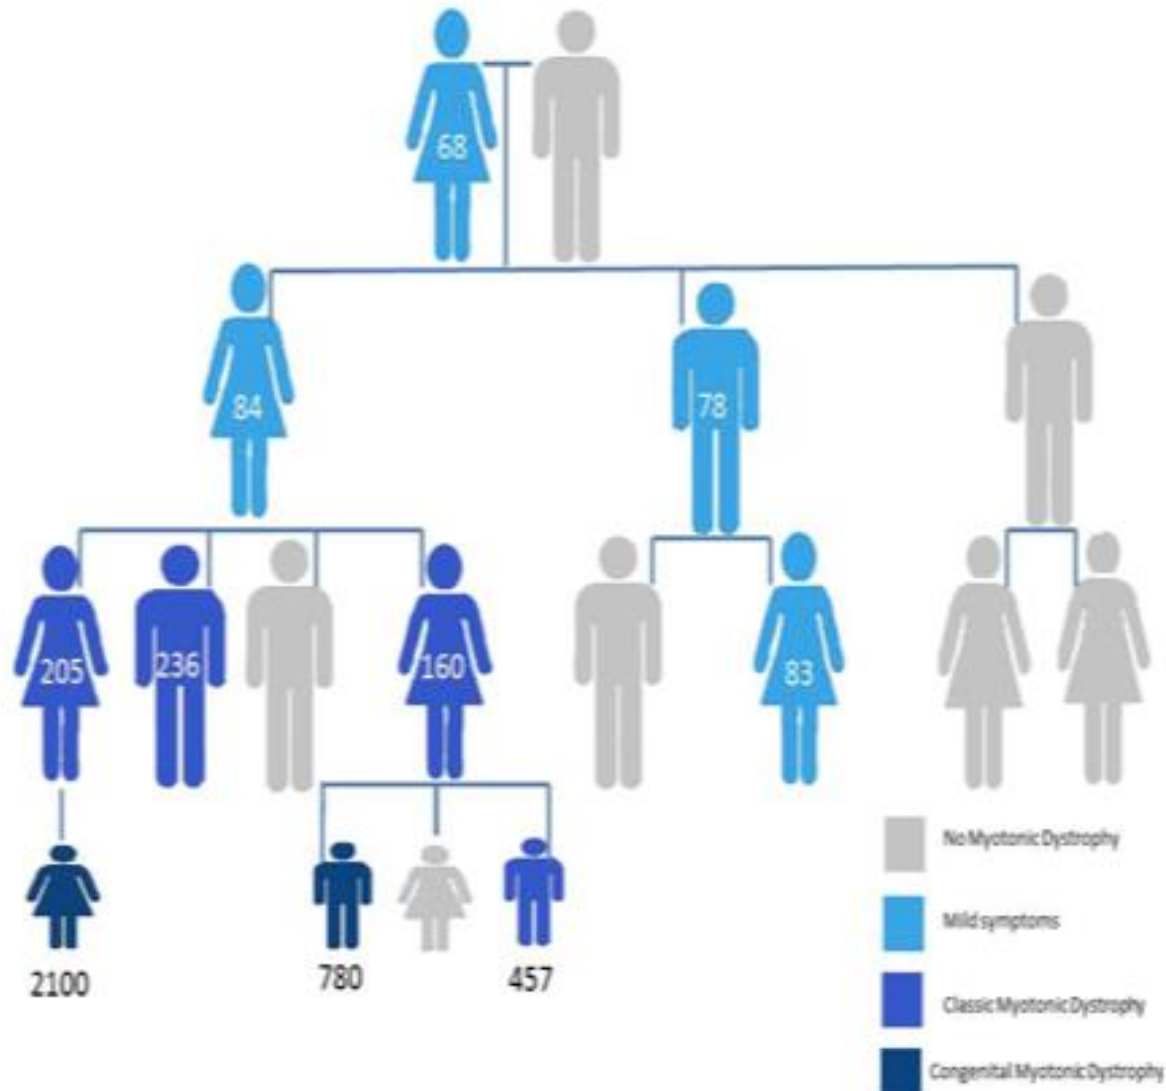

Dominant inheritance

# Dominant inheritance

- 50% chance of inheriting abnormal gene
- 50% chance at each pregnancy
- Does not alternate or “even out”

# What is anticipation?

# What is somatic mosaicism?

- Repeat size can vary between:
  - Cells
  - Tissues
  - Organs

# Review: DNA, RNA, and protein

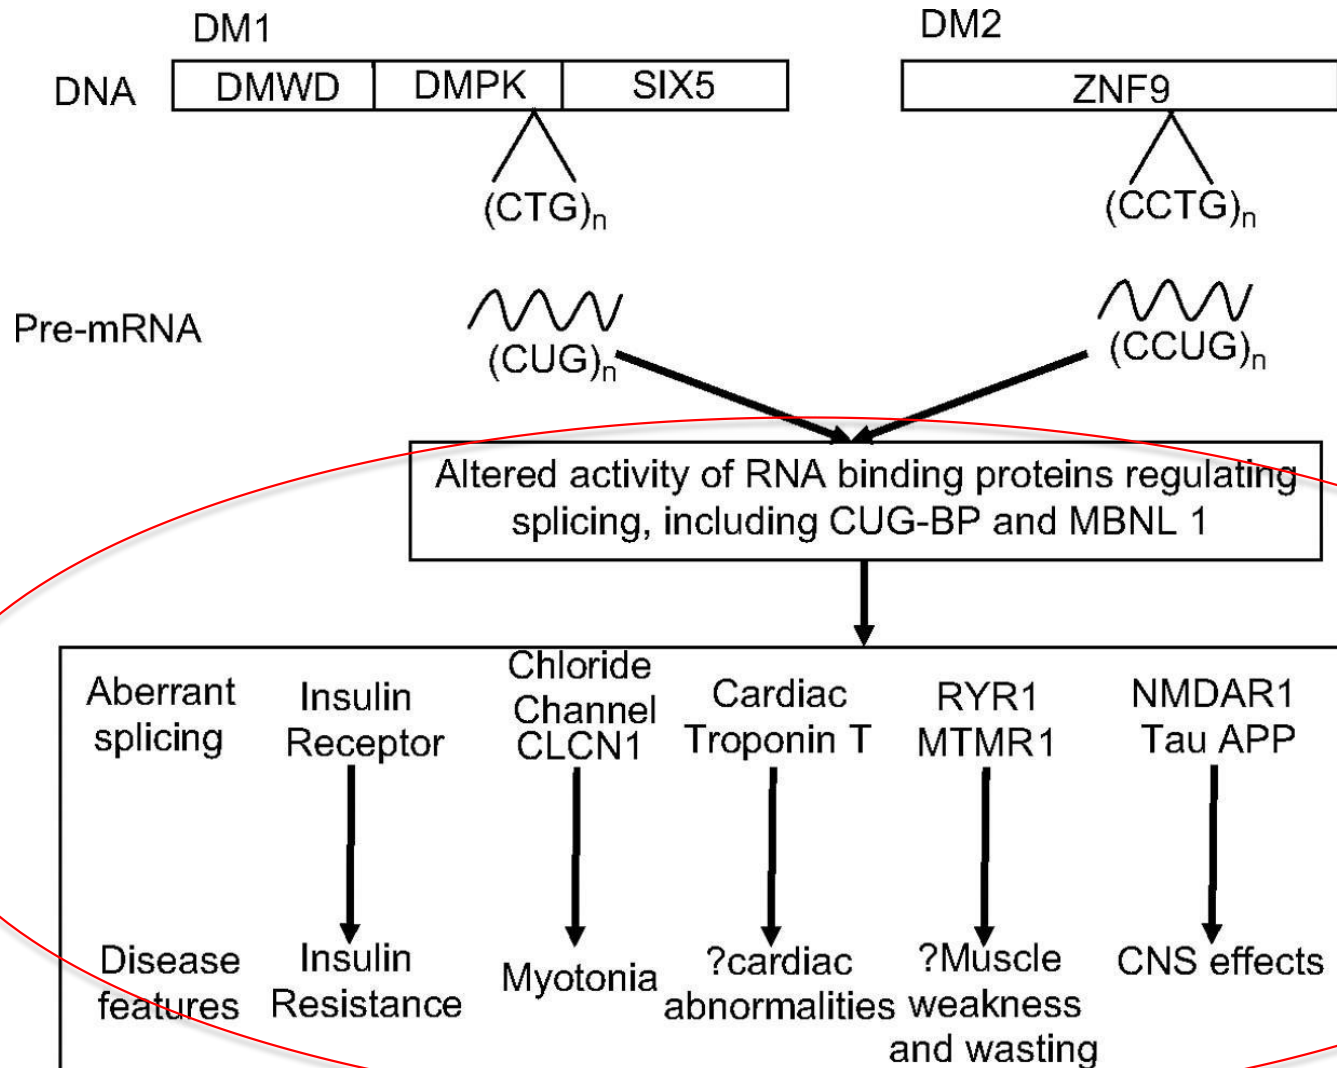

# RNA splicing is disrupted in DM

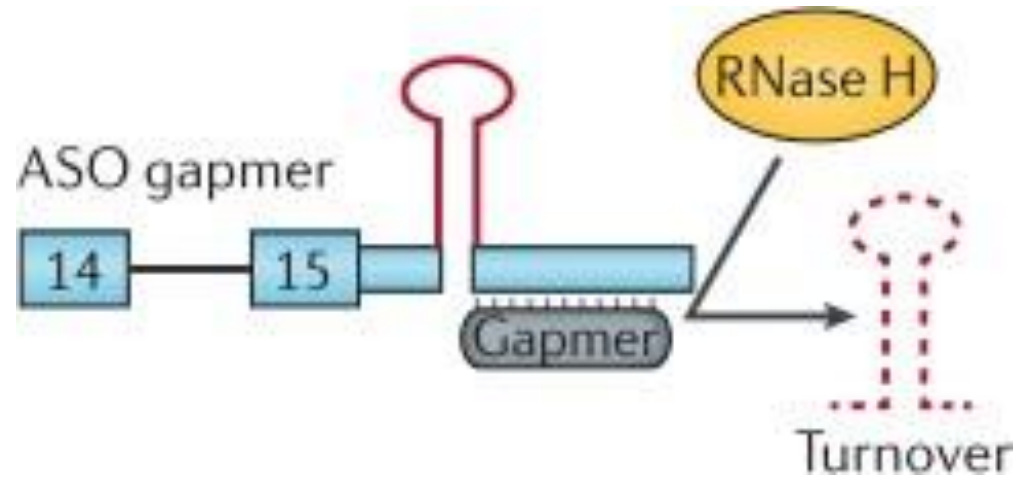

# Splicopathy

# Treatment Targets

# Multi-systemic Disease

## ENDOCRINE SYSTEM

# DM 1

# DM2

common	Facial weakness	rare
common	Difficulty swallowing, speaking	rare
common	Difficulty breathing	rare
common	Heart problems	variable
rare	Pain	common
common	Difficulty thinking, memory	uncommon
yes	Congenital form	No

# How does it affect the muscles?

---

- DM1 – distal muscles
  - Hands, ankles, but also neck
  
- DM2- proximal muscles
  - Hips and shoulders

# MUSCLE

- Myotonia (“muscle stiffness”) – delayed muscle relaxation

# MUSCLE

- Myotonia (“muscle stiffness”) – delayed muscle relaxation
- Dystrophy – progressive weakness and loss of muscle mass
- Swallowing – difficulty swallowing with risk of aspiration and slurred

# DM 1

# DM2

# How does it affect the eyes?

- Cataracts
  - “Christmas tree”
  - tinsel effect

# How does it affect the brain?

- Congenital DM1
  - Increased incidence of:
    - intellectual disability
    - Attention deficit disorder
    - Autism
- Adult onset DM1
  - Frontal and executive tasks

# How does it affect the heart?

- Heart rhythm (arrhythmia)
  - ▣ Conduction block
  - ▣ Atrial flutter or fibrillation
  - ▣ Risk of sudden cardiac death
- Cardiomyopathy
  - ▣ Decreased strength of heart muscle

# How does it affect the gastrointestinal tract?

- Swallowing difficulties (dysphagia)
  - ▣ Can lead to choking, aspiration
- Constipation
- Pseudo-obstruction
- Diarrhea
- Irritable bowel syndrome (IBS)- like symptoms

# How does it affect the lungs?

---

- The muscles of breathing
  - Diaphragm
  - Intercostal muscles (muscles between the ribs)
- Brain control of breathing in sleep
  - Sleep apnea
- Aspiration pneumonia

# How does it affect the hormones?

---

- irregular or absent menstrual periods
- Testicular atrophy
- Growth hormone
- Parathyroid hormone imbalance
- Thyroid hormone imbalance

# How does it affect sleep?

- Increased sleep requirement (hypersomnolence)
- Daytime sleepiness
- Sleep apnea and snoring
  - Obstructive
    - weak tongue and throat muscles collapse during sleep
  - Central
    - brain directing breathing rhythm
- **fatigue**

# Others

- **Pain:** DM2 > DM1

- **Cancer:** Increased risk of cancer → up to date with cancer screening

# What are the anesthesia effects of DM?

- Different types of anesthesia have different risks:
  - Weaken breathing, coughing, swallowing
  - Confusion/delerium
  - Constipation
  - Cause all-over myotonia
- See [myotonic.org](http://myotonic.org) website for anesthesia recommendations

# What can you do?

- Learn about it and inform your family
- Establish an interdisciplinary medical care team
- Preventative care (cancer screening, diabetes)
- Support groups - support each other
- Consider research – see what is right for you
